

BEATING THE CASINO BLACKJACK

For Casino & Online-Casino Gamblers

<http://casinosystems.pi-ex.com>

EARNINGS AND INCOME DISCLAIMER

We make every effort to ensure that we accurately represent these products and services and their potential for income. Earnings claimed or advertised are estimates of what we think you can possibly earn. There is no guarantee that you will make these levels of income and you accept the risk that the earnings and income statements differ by individual. As with any game of chance, your results may vary, and will be based on your individual capacity, experience, expertise, and level of desire. There are no guarantees concerning the level of success you may experience. Each individual's success depends on his or her background, dedication, desire and motivation. There is no assurance that examples of past earnings can be duplicated in the future. We cannot guarantee your future results and/or success. There are unknown risks in casino games and on the internet that we cannot foresee which can reduce results. We are not responsible for your actions.

In this eBook we explain Worldwide known BlackJack strategies which will improve your chances at a Casino BlackJack Game. However, you must understand that BlackJack is still a GAMBLING game, in which you might lose money. We take no responsibility for any money you may lose using the methods described in this eBook.

Welcome

Hi and welcome to this one of a kind FREE eBook that explains everything one should know about Blackjack, **before risking their money** in a Casino or Online Casino. Read the whole thing through, before gambling.

Why Blackjack?

Blackjack is one of the few Casino games where your actions and decisions have an effect on your odds of beating the house and earning money instead of losing it.

Playing Blackjack without really knowing what you are doing gives the house an edge of 2 to 8% over the gambler (This varying on the number of decks played. The more decks, the casino has a better edge). This means that on the long run, you will lose 2 to 8% of the money you bet each round.

Fortunately, back in 1956, an article was released, containing and explaining the "**Blackjack Basic Strategy**". This is a set of 'rules' the gambler should play by, in order to decrease the Casino's edge dramatically. This set of rules is based on complex statistical analysis, done mostly by computers.

Playing the "Blackjack Basic Strategy" reduces the houses edge to about 0.5% (again, depending on the number of decks played. If played with one deck, the gambler will actually have the edge over the house). There are further methods of improving your odds which will be described in the 'Advanced' Section of this eBook.

These are by far the best odds a gambler can have against the Casino! So let's start learning how to actually win at Blackjack.

[U.S.A Players Get \\$555 Bonus HERE](#)

The Blackjack Rules (Taken from Wikipedia)

I assume that if you are reading this eBook, you already know the Blackjack rules (if you do, feel free to skip this chapter), but just in case you don't, this is for you. Keep in mind that there are also special rules that apply only in some Casinos so make sure you know the Casino's special rules before gambling.

The Rules:

Each player is dealt two cards and is then offered the opportunity to take more. The hand with the highest total wins as long as it doesn't exceed 21; a hand with a higher total than 21 is said to bust or have too many. Cards 2 through 10 are worth their face value, and face cards (jack, queen, king) are also worth 10. An ace's value is 11 unless this would cause the player to bust, in which case it is worth 1. A hand in which an ace's value is counted as 11 is called a soft hand, because it cannot be busted if the player draws another card.

The goal of each player is to beat the dealer by having the higher, unbusted hand. Note that if the player busts he loses, even if the dealer also busts (therefore Blackjack favors the dealer, and the house has the edge). If both the player and the dealer have the same point value, it is called a "push", and neither player nor dealer wins the hand. Each player has an independent game with the dealer, so it is possible for the dealer to lose to one player, but still beat the other players in the same round.

The minimum bet is printed on a sign on the table and varies from casino to casino and even table to table. After initial bets are placed, the dealer deals the cards, either from one or two hand-held decks of cards, known as a "pitch" game, or more commonly from a shoe containing four or more decks. The dealer gives two cards to each player, including himself. One of the dealer's two cards is face-up so all the players can see it, and the other is face down. (The face-down card is known as the "hole card". In European blackjack, the hole card is not actually dealt until the players all play their hands.) The cards are dealt face up from a shoe, or face down if it is a pitch game.

[U.S.A Players Get \\$555 Bonus HERE](#)

A two-card hand of 21 (an ace plus a ten-value card) is called a "blackjack" or a "natural", and is an automatic winner. A player with a natural is usually paid 3:2 on his bet. Some casinos pay only 6:5 on blackjacks; although this reduced payout has generally been restricted to single-deck games where card counting would otherwise be a viable strategy. The move was decried by longtime blackjack players.

The player's options for playing his or her hand are:

- **Hit**: Take another card.
- **Stand**: Take no more cards.
- **Double down**: Double the wager, take exactly one more card, and then stand.
- **Split**: Double the wager and have each card be the first card in a new hand. This option is available only when both cards have the same value.

The player's turn is over after deciding to stand, doubling down to take a single card, or busting. If the player busts, he or she loses the bet even if the dealer goes on to bust.

After all the players have finished making their decisions, the dealer then reveals his or her hidden hole card and plays the hand. House rules say that the dealer must hit until he or she has at least 17, regardless of what the players have. In some casinos a dealer must also hit a soft 17 (a combination of cards adding up to either 7 or 17, such as an ace and a 6).

If the dealer busts then all remaining players win. Bets are normally paid out at the odds of 1:1.

Some common rules variations include:

- Only one card for split Aces: a single new card is added to each Ace and the turn ends. They are thus regarded as 11-point cards. No other denomination is subject to this process.
- Multiple splits: If a player splits 2 cards and receives a third card of identical value, the hand can be split again, resulting in 3 hands. However, some casinos only allow a single split of the first 2 cards.
- Early surrender: Player has the option to surrender before dealer checks for Blackjack.

- Late surrender: Player has the option to surrender after dealer checks for Blackjack.
- Double-down restrictions: Double-down may only be allowed on certain combinations of cards (usually totaling 9, 10 or 11).
- Double-down after split: Double-down may not be allowed after splitting cards. The split hands are played normally otherwise.
- Split any tens: Players may split any 2 cards which are both worth 10 points, such as a Jack and Queen. This rule is rarely used, since 20 is a very strong hand which is unlikely to be split.
- European No-Hole-Card Rule: the dealer receives only one card, dealt face-up, and does not receive a second card (and thus does not check for blackjack) until players have acted. This means players lose not only their original bet, but also any additional money invested from splitting and doubling down. A game that has no-hole-card doesn't necessarily mean you will lose additional bets as well as original bets. In Australia for example, a player beaten by a dealer blackjack may keep all split and double bets and lose only the original bet, thus the game plays the same as it would if there were a hole card.

There are more than a few blackjack variations which can be found in the casinos, each has its own set of rules, strategies and odds. It is advised to take a look at the rules of the specific variation before playing. Many countries have legal acts and laws, which determine how a casino game of Blackjack must be played.

The push: When you and the dealer get the same numbers, you can either stay in the game and take a chance at winning double your money or take your money back and start a new hand.

Insurance (Not Very Useful):

If the dealer's up card is an Ace, the player is offered the option of taking Insurance before the dealer checks his 'hole card'.

The player who wishes to take Insurance can bet an amount up to half his original bet. The Insurance bet is placed separately on a special portion of the table, which usually carries the words "Insurance Pays 2:1". The player who is taking Insurance is betting

[U.S.A Players Get \\$555 Bonus HERE](#)

that the dealer was dealt a natural, i.e. a two-card 21 (a blackjack), and this bet by the player pays off 2:1 if it wins. It is called insurance since if the dealer has a blackjack, the bet wins the same amount of the players Blackjack wager, such that if insurance is taken and the player doesn't have blackjack but dealer does, no money is lost. Of course the dealer can end up not having blackjack and the player can still win or lose the blackjack bet.

Insurance is a bad bet for the player who has no knowledge of the hole card because it has a house edge of approximately 7%. Even for the player who has been dealt a natural (a two-card 21) it is unwise to take Insurance. In such a case, the dealer usually asks the player "Even money?" This means that instead of 3:2, the player with the natural accepts to be paid off at 1:1. Thus it is exactly the same thing as buying Insurance, losing the Insurance bet and getting paid 3:2 on the natural.

In casinos where a hole card is dealt, a dealer who is showing a card with a value of Ace or 10 may slide the corner of his or her facedown card over a small mirror or electronic sensor on the tabletop in order to check whether he has a natural. This practice minimizes the risk of inadvertently revealing the hole card, which would give the sharp-eyed player a considerable advantage. In some countries, such as Australia, no face down card is dealt to the dealer until it is his turn to play his hand. This makes the game more complicated since the dealer must keep track of busted split bets since if the dealer ends up drawing a Blackjack the players lose only their original bets and do not lose double or busted split bets.

[U.S.A Players Get \\$555 Bonus HERE](#)

Understand Why the House always wins:

Well, it's pretty simple really... The rules above basically state that you can bust and lose your money, before the dealer even reveals his face-down card. Combine this with the fact that most gamblers don't have a clue about basic strategy, and some even take long-shot "hunch" decisions, and you'll understand how casinos make a LOT of money.

Understand how you can beat the odds:

The competition in the online gambling scene is HUGE. This causes casino sites to offer great Bonuses for people to sign-up. They're actually giving you free money (depending on the fact that you wager a certain amount of money on their online gambling services).

Some sites will actually give you 100% of what you deposit. So if you deposit 100\$, you get 100\$ FREE! You have to Wager 2000\$ and by playing Basic Blackjack Strategy you will probably lose about $2000\$ \times 0.5\% = 10\$$ loss. You profit 90\$! How about that?!

That was Just to get you psyched up! I will explain about that later in "**Why Bet at Online Casinos?**" Now its time to start learning. Don't worry, it's pretty simple.

[U.S.A Players Get \\$555 Bonus HERE](#)

Getting started: Basic Strategy:

Because blackjack has an element of player choice, players can reduce casino advantage to a small percentage by playing basic strategy. This determines when to hit or to stand, and also determines when to double down or split. Basic strategy is based on the player's point total and the dealer's visible card. There are slight variations depending on the house rules and number of decks. Simply, it is a table of actions for every situation. There are many tables, for different numbers of decks and different sets of rules. But here I will show and explain the most common ones. Finally, The Basic Strategy table:

Key:

H = Hit **D** = Double **S** = Stand **Ps** = Split **Ph** = Hit if
double after
Split is not
Allowed

The Dealer's Face-Up Card

[U.S.A Players Get \\$555 Bonus HERE](#)

That's all there is to it. Stick to these basic actions to improve your odds! For example if you get a 7 and a 6, and the dealer has an 8, you have a hard 13, and according to the chart, it is in your best interest to HIT. If you have an Ace and a 5, and the dealer has a 5, according to the chart, it is in your best interest to DOUBLE. If you have two Aces, no matter what the dealer has, your best odds are to SPLIT.

This is a Multiple Deck Strategy Chart But it's still pretty basic, there are more accurate charts for specific numbers of decks and certain rules.

In General, this chart will improve your odds dramatically, but if you're going to gamble a lot, and really want to hit a homerun, I recommend a chart that is more specific to the kind of game you are playing (4,6,8 decks in the shoe and so on). You can get these on various sites on the web, or from computer programs (but I'll explain about computer programs in the **Easy Card Counting** section). However, most casinos won't let you sit at the tables with lots of messy charts, but you can have a small one (about the size of a credit card), they don't mind and even sell them at the Casino's gift shops. You can get these on many sites on the net for about 5\$ or from eBay at less than 2\$ a piece.

Advanced: Easy Card Counting:

OK, now it gets interesting! I know what you're thinking "I'm not the d**n Rainman! How does he expect me to remember all the cards played in the game?!"

Well, I don't. Actually, there are very simple methods of card counting that practically anyone can master very fast. I will only explain one of these simple methods and if you want to learn more complex methods, search the web for relevant information. Before doing so, you should know that these complex methods only give a 0.15% edge over the simple ones, so I recommend not bothering with them.

So what is card counting? Card counting is a mathematical system meant to keep track of every card dealt in the game, implementing on which cards are still left in the deck to be played.

Here is a small passage from Wikipedia about Dr. Edward Thorp, the man who made all this possible:

Dr. Edward Oakley Thorp (born in August 14, 1932, Chicago) is an American mathematics professor, author, and blackjack player. He is widely known as the author of the 1962 book "Beat the Dealer", which was the first book to prove mathematically that blackjack could be beaten by card counting. The technique eliminated the advantage of the house, which had an estimated maximum of approximately 5% (when following strategies with the smallest possibility of winning, either mimicking the dealer or never busting), and instead gave the player an advantage of approximately 1%.

The reason this helps us is that if we know what 'kind' of cards are left in the deck (generally, more high cards in the deck are better for us, and more low cards are better for the casino), we can manage our wagers accordingly. If we know that 10 low value cards have been played, but only one high value card, then we should increase the size of our bets, because our odds have improved. That's why it's very important to keep track of each and every card played.

Most card counting systems start with a count of 0. This means that when you first sit down at a blackjack table, the count is 0. Depending on which counting system you are using, this count will change with every card that is dealt. You must keep track of not only the cards that you are being dealt, but every single card dealt to every player and to the dealer.

When the card count is positive, this generally means there have been more lower cards played and the deck now has a higher percentage of larger cards. When the deck has a high percentage of larger cards, the player has several different advantages:

- You Will Be Dealt More Blackjacks
- You Will Be Dealt Stronger and Higher Starting Hands
- Dealer Will Bust More Often

[U.S.A Players Get \\$555 Bonus HERE](#)

When a card count is high, the player bets larger amounts of money because they have a higher mathematical advantage (better odds). However, when the card count drops, you must wager smaller amounts, or even leave to a different table.

Sometimes people believe they have a 'lucky table'. That is a big mistake. If you had nice profits from a table, the odds will usually change back the other way, it's not luck, it's statistics.

In most US jurisdictions, card counting is legal and is not considered cheating. However, most casinos have the right to ban players, with or without cause, and card counting is frequently used as a justification to ban a player. Usually, the casino host will simply inform the player that he is no longer welcome to play at that casino.

Players must be careful not to signal the fact that they are counting. The use of electronic or other counting devices is usually illegal and almost always prohibited by the casino.

As mentioned, I will describe a simple counting method known as Hi-Lo count:

Hi-Lo Count:

Hi-Lo is the most common balanced counting system, this means that if you count the whole deck with this system, you would end up exactly how you started: with 0 !

All you have to do with this system is to learn the following table:

2,3,4,5,6	Count + 1
7,8,9	Count 0
10, J, Q, K, Ace	Count - 1

As you can see, there are separate groups of card values. The 20 small cards (2-6) are counted as plus 1 as they are played. The 12 middle cards (7-9) are considered neutral cards and do not change the count as they are played. The 20 big cards (10-Ace) are counted as minus 1 as they are played.

[U.S.A Players Get \\$555 Bonus HERE](#)

With this simple system, it's very easy to keep track. Let's say the cards drawn on the first round were 2, Ace, K, 9, 4, 5, 7 and 6. The 2, 4, 5 and 6, each subtract 1 from the count. The seven is neutral. The Ace and King each add 1 to the count. So we are left with $0+4-2=2$. The count is positive, so now would be a good time to increase our wagers. Easy right?

This system is my personal favorite and there's a reason it's the most common system used in black jack teams, it's simple and effective!

This system only has one problem. Imagine that you have a +4 count which is a nice advantage. Or is it? If there are 4 decks left to play, you have a +1 advantage per deck. If there are 2 decks left to play, you have a +2 advantage per deck and if there is one deck, you have a +4 advantage. This is referred to as "The true count". According to statistics, each positive count, gives you an edge of 0.5% against the Casino, so playing basic strategy, at +2, you already have an edge against the Casino. That's why you always need to take in consideration the true count and not the running count.

You can also use computer programs such as free blackjack calculators. A Blackjack calculator is a very useful tool, though the free ones, aren't known for their accuracy ;) The calculator will draw you a table like the basic strategy chart according to specific parameters you fill in. For instance it just figured out for me that if I was playing a 6 deck game, and 8 'number 5' cards had already been drawn, I would have a 0.235% edge over the house playing the specific table it drew for me. A casino will never let you use something like this, and some online-casinos forbid it in their policy, but it's a tool you should be familiar with.

Picking a table:

Part of a gambler's strategy is picking the right bets on the right tables. If you had some good first rounds, with many tens, royalties and Aces, leave the table with the small profits you made when you Hi-Lo count is at -4! Don't hope that the luck will continue because that was your luck, and if you continue playing you'll end up where you started. It's time to move on to a different table.

If you had profits although the majority of the cards dealt were Positive count cards, this is the break you've been waiting for! This table has a high revenue potential, since the good cards are yet to arrive! Stay at the table and play by the system.

If you lose money on the rounds with many good cards (tens and aces), leave this table, don't wait for the upper hand, you won't have it on this table.

In most games, the count will stay about even, you will have to play by the strategy, count cards, and wait for the right opportunity to strike (or quit).

Never join tables if you sense the other players there are amateurs; this will distract you and hurt your odds.

Dealer Tells:

This is only relevant to a real live Casino! You don't have this benefit at Online Casinos (you have much better benefits online).

On the latest James bond feature "Casino Royale", James Bond meets the villain "Le Chiffre" at a poker table for a game wagering about 100 million dollars (can't remember the exact number and it doesn't really matter). Le Chiffre is a mathematical genius and wins hands by calculating his odds, as opposed to his opponent's. James Bond is a spy and his gift is reading people's facial expressions and body language, helping him in calling his opponent's bluffs.

[U.S.A Players Get \\$555 Bonus HERE](#)

Every strategy I've explained so far is Le Chiffre's style, based on mathematical calculations, and statistical certainties. The **'Dealer Tells'** method is James Bond's style; it's based on reading people and requires a certain talent at it.

'Dealer tells' are subconscious gestures or expressions that a Blackjack dealer might make without knowing about it. If you can learn to spot dealer tells, you can greatly increase your edge in blackjack.

Though some people will discredit it, the **'Dealer tells'** definitely works and improves your edge if you use it correctly. One thing to keep in mind when it comes to dealer tells is that not all dealers will show expressive tells. You might play several different tables before finding a blackjack table with a dealer that has noticeable tells.

One of the most common types of dealer tells is that the dealer accidentally reveals his hole (under) card. To pull this tell off you must carefully watch how long the dealer glances at the hole card and at what type of angle he bends the card at to be able to clearly see his under card before continuing game play. This tell has two common variations:

- Dealer has a stiff card (2,3,4,5,6) in the hole, and is required to lift the card a bit more than usual to make sure it's not an Ace. The hardest card to spot at first glance is the 4, and even experienced dealers might sometimes have to re-lift it.
- The opposite of that is obviously a high or paint card (8,9,10,J,Q,K). The dealer will need a very brief glance at the under card (that seems faster than usual), there is a good chance he's holding a paint card or a card larger than a 7.

Shuffle Tracking:

Shuffle tracking is a very difficult and extreme method, used by pro's that if executed correctly, could give you a huge edge, but if not, could be disastrous for you.

This technique, mainly applicable in multi-deck games (aka shoes), involves tracking groups of cards (aka slugs, clumps, packs) during the play of the shoe, following them through the shuffle and then playing and betting accordingly when those cards come into play from the new shoe. This technique, which is admittedly much more difficult than straight card counting and requires excellent eyesight and powers of visual estimation, has the additional benefit of fooling the casino people who are monitoring the player's actions and the count, since the shuffle tracker could be, at times, betting and/or playing opposite to how a straightforward card counter would.

Arnold Snyder's articles in Blackjack Forum magazine brought shuffle tracking to the general public. His book, The Shuffle Tracker's Cookbook, mathematically analyzed the player edge available from shuffle tracking based on the actual size of the tracked slug. Jerry L. Patterson also developed and published a shuffle-tracking method for tracking favorable clumps of cards and cutting them into play and tracking unfavorable clumps of cards and cutting them out of play. Other legal methods of gaining a player advantage at BlackJack include a wide variety of techniques for gaining information about the dealer hole-card or the next card to be dealt.

Card tracking is restricted when the casino uses a half-cut, or what is known inside houses as 'The Big C'. This is when the shoe is cut halfway, meaning that only half of the shoe will be played, so on an 8-deck shoe, only 4 decks will be played and thereafter shuffled. As card tracking relies on the principles of elimination, the half-cut makes it virtually impossible to eliminate or predict the remaining cards. Another exception to card tracking is the introduction of automatic shuffler machines, thereby making it impossible to track cards because the shoe is non-stop.

[U.S.A Players Get \\$555 Bonus HERE](#)

Avoiding Casino Cheats:

If you read this whole eBook through, by now you know that Blackjack is a game of statistics. Now imagine how easy it is to cheat you. At an online Casino the computer software could be programmed to make you bust or give the dealer a Blackjack every 50 rounds and you would never know and just think you had bad luck. This also happens at live Casinos; it takes the skills of the average stage magician to check the first card of the deck and decide if it's in the Casinos best interest to give you this card or a different one. What would removing two paint cards and adding a 5 to the deck do to your odds?

That is why the gamblers community consistently checks both Online and Offline Casinos for authenticity in various ways, and occasionally bans Casinos for fraud. However, it doesn't mean that you can just bet wherever you want! Bet only at trusted Online Casinos (check the next pages to see a list of these Casinos, and what bonuses they offer), and when you're at the Casino, always stay sharp, never drink too much and make sure the dealer see's it's not wise to try and fool you.

Why Bet at Online Casinos?

Now, the part you've been waiting for... "How can I actually profit from gambling?!". Well, as I explained before the competition in the online gambling scene is HUGE. That causes sites to offer great Bonuses for people to sign-up. They're actually giving you free money (depending on the fact that you wager a certain amount of money on their online gambling services).

Some sites will actually give you 100% of what you deposit. So if you deposit 100\$, you get 100\$ FREE! You have to Wager 2000\$ and playing Basic Blackjack Strategy you will probably lose about $2000\$ \times 0.5\% = 10\$$ loss. You profit 90\$!

Don't get me wrong, I'm not telling you to quit your day job (or whatever it is that you do), and start a career at online gambling! I'm also not telling you that I can teach you an amazing system which you can use to enter a Casino with 500\$ and leave with 5000\$, and I'm going to reveal my secrets for a onetime payment

of 49.95\$ (Mainly because no such thing exists). I'm simply giving you an option of making money taking advantage of the fact that online Casinos are willing to go a long way and dig deep in their pockets, to attract new amateur gamblers. The thing is, having read this eBook; you are not an amateur any more.

All I'm saying is give this system a shot; if you read this, you probably gamble anyway; I just want you to do it the smart way!

A List of Trusted Online Casinos:

The following are the Best Online Casinos which I STRONGLY Recommend. There are hundreds of online casinos available, but after careful research I have selected the best two which I describe below:

*** This information is relevant to June 08, the bonuses might change but these will still remain the best places to make a deposit. All these Casinos have a payout rate of 97% or more. ***

[Casino-on-Net \(888\)](#)

This is the largest online Casino accepting players from all over the world (Except USA). Launched in 1997, this is one of the oldest and most visited Online-Casinos worldwide. Over 25 Million people have experienced Casino-on-Net gaming action, making it the largest online gaming venue. It is also listed in the London Stock Exchange making it one of the most trustworthy Casinos on the Internet.

Casino-on-Net offers tons of awards, and has good sign-up bonuses (**100% up to 200\$**), a 97.6% payout rate, and most importantly, the rule set with the best odds!

Conclusion – Very Important

I hope you enjoyed this Free ebook and learned a couple of things.

Let me just add that Blackjack is still a gambling game; the odds might surprise you in any way. Just like you could win 1000\$ in one lucky night, you could lose them in another day. That's why I urge you NOT TO GAMBLE WITH MONEY YOU CAN'T AFFORD TO LOSE. It is also in your best interest to play the free games offered by online casinos at the beginning before start gambling with real money. This will help you get the hang of the game and also practice the methods described here.

Learn the Basic Strategy for BlackJack and the Card Counting technique and enjoy the game.

By the way, you may have noticed that some of the content, grammar or definitions here aren't exactly Shakespeare English. Don't think that I'm a retard or that I don't know anything about Blackjack. It's just that English isn't my mother language. Thank god for the automatic spell checker and dictionary!!
