

Simple Sending for Mailit 7

Welcome to Simple Sending for Mailit 7!

The Simple Sending solution set with the FileMaker plug-in Mailit 7 enables you to send emails for one account only.

These simple solutions consist of two example files. The first example sends messages using a common step-by-step scripting interface.

The second file illustrates sending process in a thread.

As the name suggests the scripting of these files is kept to a minimum in order to make it easier to understand the functions of Mailit 7. Using these files you will be able to send one email at a time for one email account only.

The Personal Mail example file, which is also part of the package you downloaded is a more advance email solution.

All scripts are accessible for viewing. They can also be imported into your own solution.

In combination with the Mailit 7 manual this is a good starting point to implement Mailit 7 functions into your FileMaker solution.
